

FLEXIBLE LED CABLE LIGHT

BACKGROUND OF THE INVENTION

1. Field of the Invention

The present invention relates to a flexible LED illumination device, and more particularly to an improved flexible LED cable light.

2. Description of Related Art

LED cable lights have high brightness and low power consumption so they are usually decorative lights for houses, offices, stores, etc. Furthermore, the LED cable light is flexible so the LED cable light is easy to store and decorate curved places and is even portable. To decorate large exterior walls of buildings, the LED cable light must be waterproof, low cost, cuttable or joinable, etc.

To meet the foregoing requirements many types of LED cable lights have been developed. With reference to Fig. 14, a first type of conventional LED cable light has a pair of wires (20, 21), multiple LED chips (22) and an epoxy sheath (23). The wires (20, 21) are connected to low power source (not shown). Each LED chips (22) is connected between the pair of wires (20, 21), and the epoxy sheath (23) covers the pair of wires (20, 21) and the LED chips (22). Therefore, the first type of conventional LED cable light is waterproof function but cannot be cut or joined easily. Therefore, the first type of conventional LED cable light does not completely meets the foregoing requirements.

With reference to Fig. 15, a second type of conventional LED cable light includes an insulator substrate (25), wires (not shown) and LEDs (26).

1 The wires are on the insulator substrate (25), and the LEDs (26) are connected
2 to the wires. The wires are usually made of aluminum, gold etc. The wires are
3 expensive material so the second type of conventional LED cable light is not
4 cheap. Furthermore, the second type of conventional LED cable light does not
5 have a joinable structure or connector so the cable light does not meet the
6 necessary requirements.

7 With reference to Fig. 16, a third type of conventional LED cable light
8 has a multi-layer substrate (27), conductors (28), LEDs (29), spacers (50) and
9 lenses (51). The multi-layer substrate (27) has two opposite sides (not
10 numbered), and the LEDs (29) and the two conductors (28) are mounted on the
11 multi-layer substrate (27). The LEDs are connected to the two conductors (28),
12 and the lenses are mounted across the two opposite sides to cover the LEDs and
13 the two conductors (28). The third type of conventional LED cable light can be
14 cut different lengths but has a very complex structure. Consequently, the
15 fabricating cost of the third type of conventional LED cable light is higher than
16 the other types described. Therefore, the third type does not meet the forgoing
17 requirements either.

18 With reference to Fig. 17, a fourth type of conventional LED cable
19 light includes an insulation layer (52), conductors (53) and LEDs (54). The
20 conductors (53) are embedded in the insulation layer (52). Each LED (54) has
21 two contacts (541) that puncture the insulation layer (52) and connects to the
22 conductors (53). The fourth type of conventional LED cable light has a simple
23 structure so the cable light is easy to fabricate and the cost is cheap. However,
24 the fourth type of conventional LED cable light is not very waterproof because

1 the contacts (541) of the LED (54) puncture the insulation layer (52). Therefore,
2 the fourth type of conventional LED cable light does not meet the necessary
3 requirements.

4 With reference to Fig. 18, a fifth type of conventional LED cable light
5 has a substrate strip (55), a printed circuit (551), surface mounted technology
6 (SMT) LEDs (56) and an insulation layer (57). The printed circuit (551) is
7 formed on the substrate strip (55). The SMT LEDs (56) are connected to the
8 printed circuit (551), and the insulation layer (57) covers the substrate strip (55),
9 the printed circuit (551) and LEDs (56). The LEDs (56) are connected to the
10 printed circuit (551) so the substrate strip (55) having the printed circuit (551)
11 must be required. Therefore, the fifth type of conventional LED cable light has
12 complex fabricating process and has a relatively high cost.

13 The conventional LED cable lights either are not waterproof or
14 affordable or cannot be easily cut and joined. Therefore, the present invention
15 provides a flexible LED cable light to achieve the aforementioned features.

16 SUMMARY OF THE INVENTION

17 The main objective of the invention is to provide a flexible LED cable
18 light that is waterproof, affordable, cuttable, joinable, etc.

19 In accordance with the present invention, an LED cable light includes
20 an insulation body having a longitudinal slot and multiple vertical notches to
21 respectively communicate with the longitudinal slot, at least two wires of
22 multiple strands, a plurality of LEDs respectively mounted on circuit boards
23 and a protective layer. The at least two wires are embedded in parallel in the
24 insulation body, and the LEDs mounted on the circuit boards are respectively

1 received in a corresponding one of the notches and connected to the at least two
2 wires by conductors. The LEDs can further connect in serial to resistors
3 received in the longitudinal slot to form multiple strings. The LEDs or strings
4 are electrically connected in parallel to the two wires. The LEDs used in the
5 present invention refer to the three types such as SMT LEDs, LED bare chips
6 and sealed cube LEDs.

7 Other objectives, advantages and novel features of the invention will
8 become more apparent from the following detailed description when taken in
9 conjunction with the accompanying drawings.

1 DETAILED DESCRIPTION OF THE PREFERRED EMBODIMENT

2 An LED cable light in accordance with the present invention has a flat
3 insulation body, at least two wires of multiple strands, multiple LEDs and a
4 protective layer.

5 With reference to Fig. 1, a first embodiment of the flexible LED cable
6 light has an insulation body (3), two wires (2a, 2b), multiple LEDs (4) and a
7 protective layer (5).

8 Each LED is a surface-mounted technology (SMT) package LED (4)
9 and has a driving voltage that is about 2.1V to 4.0V. The two wires (2a, 2b) are
10 embedded parallel in the insulation body (3) and a specific distance (d) existed
11 between the two wires (2a, 2b). The insulation body (3) has a series of multiple
12 individual notches (41). Each notch (41) has a depth that is deeper than that the
13 wires (2a, 2b) are embedded, so the two wires (2a, 2b) are exposed to
14 electronically connect to the LED. The notches (41) are slightly larger than the
15 LEDs (4) so the LEDs (4) are mounted respectively in the notches (41) and are
16 electrically connected in parallel to the two wires (2a, 2b). The LEDs (4) are
17 electrically connected to the wires (2a, 2b) by soldering or forming two prongs
18 (not numbered) to insert into the wires (2a, 2b). The protective layer (5) covers
19 the insulation body (3), the notches (41), the LEDs (4) and the exposed wires
20 (2a, 2b). The protective layer (5) is made of polyvinyl chloride (PVC) material.
21 The protective layer (5) is made of transparent or semi-transparent material.

22 With reference to Fig. 2, the multiple LEDs (4) are connected in
23 parallel to the two wires (2a, 2b) so the LED cable light can be cut to desired
24 lengths. The insulation body (3) with the wires (2a, 2b) of multiple stands is

1 extremely flexible has good conductivity, large current-resistant, etc. The
2 insulation body (3) has a lateral cross sectional area (A) of 6mmx2mm, and
3 each wire (2a, 2b) has a diameter that is about 0.127mm to 0.254mm. The
4 specific distance (d) between the two wires is 4mm.

5 With reference to Fig. 3, the first embodiment of the LED cable light is
6 connected to a power source. The LED cable light is optionally connected to
7 the power source through a power adapter (not numbered). The power adapter
8 has a power transformer (9) having power output and power input, a plug (10),
9 a socket (902), a conductor (not numbered) and two power lines (101, 901).
10 The plug (10) is connected to the power input of the power transformer (9)
11 through one power line (101), and the socket (902) is connected to the power
12 output of the power transformer through the other power line (901). With
13 further reference to Fig. 4, the conductor has a plastic base (11a), two power
14 prongs (71c, 71d) and two awl-shaped prongs (71a, 71b) with sharp points (not
15 numbered). The plastic base (11a) has two opposite ends (not numbered). The
16 two power prongs (71c, 71d) are mounted on one end of the plastic base (11a),
17 and the two awl-shaped prongs (71a, 71b) are mounted on the other end of the
18 plastic base (11a). The power prongs (71c, 71d) are inserted into the socket
19 (902), and the two awl-shaped prongs (71a, 71b) are connected to the two wires
20 (2a, 2b) in the insulation body (3). A joint between the plastic base (11a) and
21 protective layer (5) can be sealed by glue (not shown) and further covered by a
22 tube (81).

23 With reference to Figs. 3 and 5, the LED cable lights are joinable. Two
24 segments (61, 62) of the LED cable lights are connected together by a

1 connector (not numbered). The connector is composed of a plastic base (11b)
2 having two opposite ends, two first awl-shaped prongs (72a, 72b) with sharp
3 points (not numbered) and two second awl-shaped prongs (72c, 72d) with sharp
4 points (not numbered). The first and second awl-shaped prongs (72a, 72b, 72c,
5 72d) are mounted respectively on the two ends. The first awl-shaped prongs
6 (72a, 72b) are pushed into the two wires (2a, 2b) in the insulation body (3) of
7 the one segment (61) and the second awl-shaped prongs (72c, 72d) are pushed
8 into the two wires in the insulation body (3) of the other segment (62) to
9 complete the joint of the two segments (61, 62). The joint between the plastic
10 base (11b) and the two protective layers (5) can be sealed by glue (not shown)
11 and further covered by a tube (82), such arrangement can make the LED cable
12 light an absolute waterproof capability.

13 With reference to Fig. 6, a second embodiment of the LED cable lights
14 in accordance with the present invention is similar to the first embodiment. The
15 second embodiment has a flat insulation body (3'), two wires (2a, 2b), multiple
16 LEDs (4) and a protective layer (5).

17 The multiple LEDs (4) are connected to form multiple strings each
18 comprising a plurality of LEDs (4). Each string of LEDs (4) has at least one
19 resistor (12) connected to the LEDs (4) of the string in serial.

20 The insulation body (3) has multiple individual notches (41) that are
21 arranged in one row, multiple pairs of holes (44) and a narrow longitudinal slot
22 (301). The pairs of holes (44) correspond respectively to two terminals of the
23 strings. The narrow longitudinal slot (301) communicates with the row of
24 multiple individual notches (41). Each notch (41) has a width that is narrower

1 than the specific distance (d) between the two wires (2a, 2b), so the two wires
2 (2a, 2b) are not exposed by the longitudinal slot (301) or the row of individual
3 notches (41). Each resistor (12) is smaller than the LEDs (4) so the resistors (12)
4 can be mounted in the longitudinal slot (301). Each pair of holes (44) is defined
5 in the insulation body (3), and the holes (44) in each pair align respectively
6 with the two wires (2a, 2b). Therefore, the two wires (2a, 2b) are exposed at the
7 holes (44).

8 The two terminals of each string are connected to the two wires (2a, 2b)
9 through the pair of holes (44). Therefore, each light unit is connected in parallel
10 electrically to the two wires (2a, 2b). Each string is composed of LEDs (4) and
11 resistors (12) so voltage to drive each string is increased. That is, the two wires
12 (2a, 2b) can be connected to larger power source without the power transformer
13 (not shown). For example, the driving voltage of each light unit can be 12V,
14 24V, 120V, 240V, etc.

15 With reference to Fig. 7, a third embodiment of LED cable light in
16 accordance with the present invention is similar to the second embodiment. The
17 third embodiment has a flat insulation body (3"), three wires (2a, 2b, 2c),
18 multiple strings (not numbered) and a protective layer (5).

19 The three wires (2a, 2b, 2c) are embedded in parallel in the insulation
20 body (3"). The insulation body (3") defines two rows of multiple individual
21 notches (41, 411), multiple pairs of holes (44) and two narrow longitudinal slots
22 (301a, 301b). Each pair of holes (44) is defined on the insulation body (3"), and
23 the holes (44) in each pair align respectively with adjacent wires (2a, 2b, 2c).
24 The two narrow longitudinal slots (301a, 301b) are respectively communicated

1 with the corresponding the two row of individual notches (41,411). Each string
2 is composed of multiple LEDs (4,4a) and resistors (12,121) in series and has
3 two terminals. The multiple light units are connected in parallel respectively to
4 adjacent wires (2a, 2b, 2c).

5 With reference to Fig. 9, the SMT package LEDs are further
6 respectively mounted on circuit board (42). With further reference to Fig. 8, the
7 second embodiment of the LED cable light uses the multiple SMT package
8 LEDs (4) on the circuit boards (42). The SMT package LEDs are connected to
9 form multiple strings each comprising a plurality of SMT package LEDs (4).
10 Each string of LEDs has at least one resistor (121) connected to the LEDs of
11 string in serial, and then is electrically connected to the at least two wires (2a,
12 2b) in parallel.

13 The SMT package LEDs (4) are respectively received in a
14 corresponding one of the multiple notches (41) and the resistors (121) are
15 received in the longitudinal slot (301). The SMT LED (4) being moldered on
16 the circuit board (42) and the application of the protective layer (5), so the LED
17 cable light of the present invention can be free for folding and bending without
18 damage of the electrical connection between the SMT package LEDs (4).

19 With reference to Fig. 11, the second embodiment of the present
20 invention uses another type of the LEDs. The LED is an LED bare chip (4').
21 the LED bare chips (4') are respectively mounted on circuit boards (42). The
22 method of mounting LED bare chips (4') directly on a circuit board (42) is
23 known in the art, so such arrangement can make a much cheaper and smaller
24 light device. Fig. 10 illustrate the cable light of the present invention uses the

1 LED bare chips instead of the SMT package LEDs.

2 With reference to Figs. 12 and 13 the present invention uses another
3 type of the LED. The type of LED is a sealed cube LEDs (4''). The sealed cube
4 LEDs (4'') mounted on a top face of the circuit board (42) and has two
5 conductors (X, Y). The two conductors (X, Y) are respectively inserted into the
6 circuit boards (42) and then the two conductors (X, Y) are molded onto a
7 bottom face of the circuit board (42). Such type of LED can easily mount on
8 the circuit board (42).

9 Further, the present invention includes a twin adhesive (not shown)
10 bonded to the protective layer (5) to attach the cable light in a fixed position.

11 The LED cable light uses the wires so it is suitable for decorating long
12 distances. Further, the LED cable light has simple structure in the insulation
13 body and a protective layer so the cable light is easily and simply fabricated
14 and is waterproof. Furthermore, the LED cable light is also suitable for
15 decorating short distances because the LED cable light can be cut to different
16 lengths. Furthermore, the segments can be further connected together by the
17 connector. That is, the LED cable light in accordance with the present invention
18 is waterproof, inexpensive, cuttable, joinable, etc.

19 Even though numerous characteristics and advantages of the present
20 invention have been set forth in the foregoing description, together with details
21 of the structure and function of the invention, the disclosure is illustrative only,
22 and changes may be made in detail, especially in matters of shape, size, and
23 arrangement of parts within the principles of the invention to the full extent
24 indicated by the broad general meaning of the terms in which the appended

1 claims are expressed.
